Challenge
iOS Developer

Thank you for your application! We like what we have seen so far from you and want to take the next step: Inviting you to a small challenge.

Develop an iPhone app that enables you to track your walk with images.

The user is starting the app and presses the start button. After that he puts the phone into his pocket and starts walking, every 100 meters a picture for his location is requested from the flickr photo search api and added to his stream. New pictures are added on top.
Any time he takes a look at his phone he sees the most recent picture and can scroll through a stream of pictures which shows him impressions of where he has been. It should work at least for a two hour walk.
The user interface should be simple as shown on the left of this page.

An excellent iOS Developer should manage to do this challenge in a few hours. So please block some time during the next days and impress us with your development skills by not using 3rd party code. Send us the source as Xcode project and what you have learned while developing.
